Frequently asked questions:
1. Should the FCN be “hands-on” versus “hands-off”?
2. Can the FCN do glucose testing?

All nursing practices fall under the legal authority of each State’s Nurse Practice Acts and State Board of Nursing Policies. Scope and Standards of Practice documents reflect the thinking of the nursing profession and provide guidance for nurses in the application of their professional skills and responsibilities. It is up to the nurse who is practicing as a FCN to assess one’s skills, knowledge, and comfort in following any medical orders. Additionally, an employer or setting of practice may limit the scope of practice for the FCN. It is recommended that every FCN have malpractice insurance. The International Parish Nurse Resource Center FCN Foundation’s Course (Professionalism: Legal and Documentation modules) offers information and recommendations regarding practice responsibilities.

In fact, the FCN certification by portfolio facilitated by the American Nurses Credential Center (ANCC) is based upon the Faith Community Nursing Scope and Standards of Practice (ANA & HMA, 2017). It is important to note here that ANCC made a decision in Fall of 2017 to not facilitate any new certifications by portfolio, which included FCN certification. Renewal of FCN certification still continues for those who initially received it (RN-BC Faith Community Nurse). Renewal information is available at https://www.nursingworld.org/our-certifications/faith-community-nursing-renewal/

3. Should FCN be hands-on?
   Even though there are several FCN interventions that are considered “hands-off”, a skill set that all nurses should have is the ability to do a physical assessment. A thorough physical assessment requires “hands-on” the patient’s body to auscultate breath sounds, assess lymph nodes, palpate pulses, and assess skin turgor …etc., especially if the patient was recently discharged from a hospital or has a chronic disease. A guide for a head to toe physical assessment is available at http://nursinglink.monster.com/benefits/articles/184-how-to-perform-a-head-to-toe-assessment.
4. Can FCN do glucose testing?
Diabetes management can be facilitated by FCN who have received specialized education. Performing a finger-stick for blood glucose testing may be considered part of diabetes management for reasons of demonstration and education. Our goal in demonstration should always be patient self-management and self-efficacy. It is preferred to have the patient demonstrate a finger-stick to the FCN than the other way around.

The FCN needs to possess knowledge of:
- Why and when to do glucose testing (the science behind it)
- How to use the glucose meter (testing and recalibration)
- What to do with the results (interpretation)
- What education does the client need (resources and diary)
- When and where to refer the client to (physician-clinic)
- How and where to purchase lancets and dispose of them properly
- Documentation using a standardized nursing language
- Follow-up and follow through for the client

It is recommended that the FCN:
- Have additional education regarding diabetes management or seek guidance from other health care team members, such as diabetic educator, nutritionist, and/or physician.
- Be familiar with state laws and professional guidelines regarding practice issues.

Regarding glucose testing as a mass screening tool, the American Diabetic Association (2015) suggest that “…there is insufficient evidence to conclude that community screening is a cost-effective approach to reduce the morbidity and mortality associated with diabetes in presumably healthy individuals. While community screening programs may provide a means to enhance public awareness of the seriousness of diabetes and its complications, other less costly approaches may be more appropriate, particularly because the potential risks are poorly defined. Thus, based on the lack of scientific evidence, community screening for diabetes, even in high-risk populations, is not recommended”. Retrieved at http://care.diabetesjournals.org/content/25/suppl_1/s21.full. Diabetes screening tools are available at https://www.cdc.gov/diabetes/prevention/pdf/prediabetestest.pdf and http://www.diabetes.org/are-you-at-risk/diabetes-risk-test/.

Targeted screenings for individuals with high risk (BMI > 25, family history, co-morbidities, etc.) should include a referral to a physician.
Here are seven studies regarding the use of glucose testing and FCN:
